## 1 Installation

Installation of the SQL browse template is completely automatic. You can start the RadSQL .exe. This installation program will not only install the templates, but also the classes and a demo program. The templates can automatically register themselves in your template registry.

The files installed are the following:

<b>\libsrc</b>	RADSQL b.inc
	RADSQL b.clw
	RADSQL v.inc
	RADSQL v.clw
	RADSQL dr.clw
	RADSQL dr.inc
<b>\template</b>	RADSQL br.tpl
	RADSQL drop.tpl
<b>\examples\SQL Browse</b>	Orademo.app
	Orademo.dct

The RADventure SQL browse templates contains several different templates:

- a browse procedure template complete with insert, update, delete and select button
- a lookup locator control template
- A SQL dropdown template
- Browse update button controls
- Edit in place extension for the browse
- An integrated browse/ Form control template

## 2 SQL Browse Procedure Template

To use the SQL browse template use the following steps:

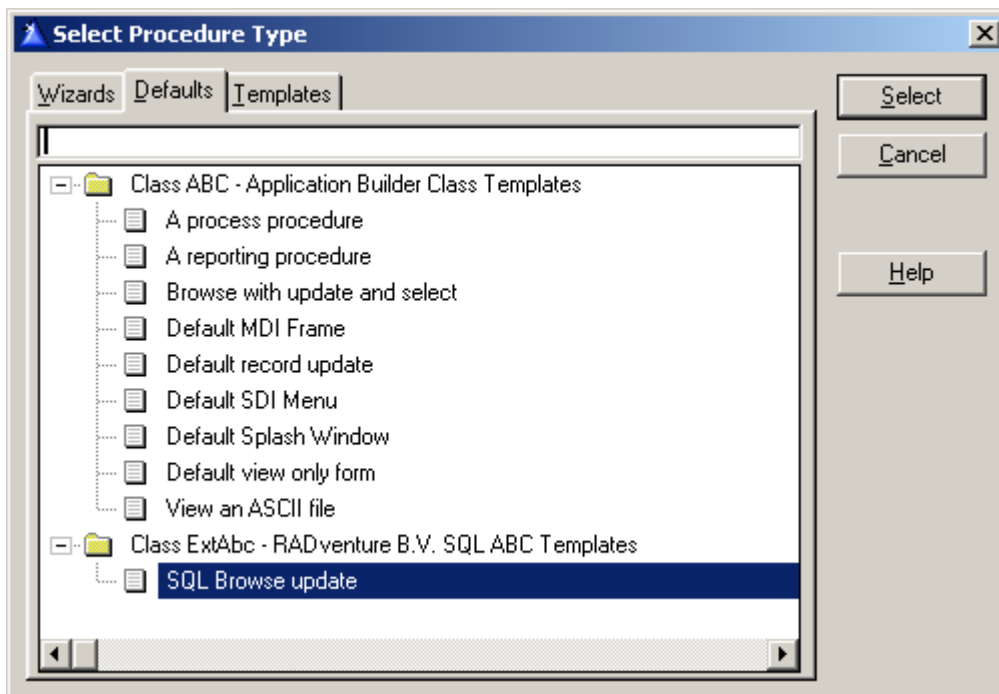

- 1) Open any valid Clarion application that contains a dictionary
  - a) Open the Clarion IDE
  - b) Open your application

2) Click on the menu ‘**Procedure**’ then ‘**New**’

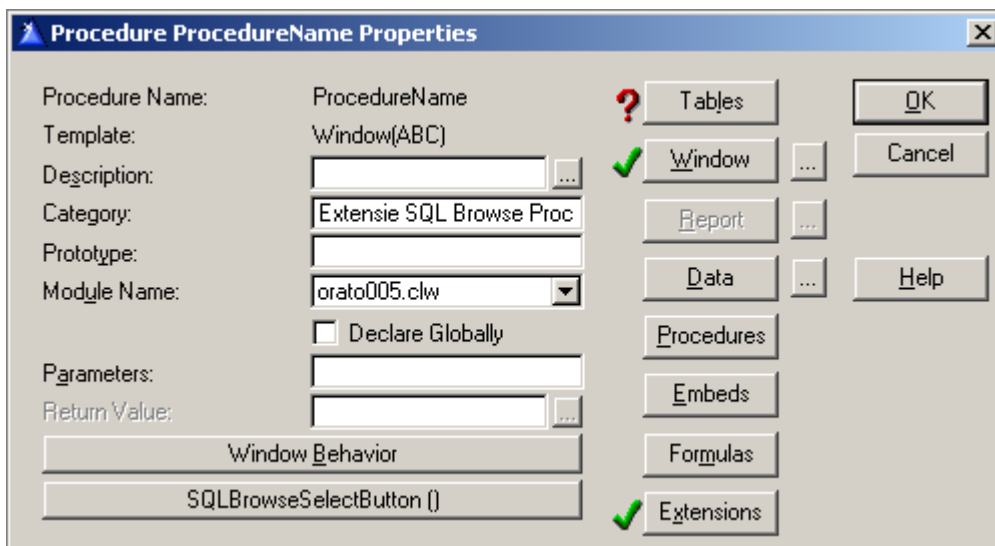

3) After entering the name of the new procedure select from the available procedure templates:

### **SQL Browse update**

The following screen representation is a sample of the screen that appears at this point (depending on your own loaded template utilities)

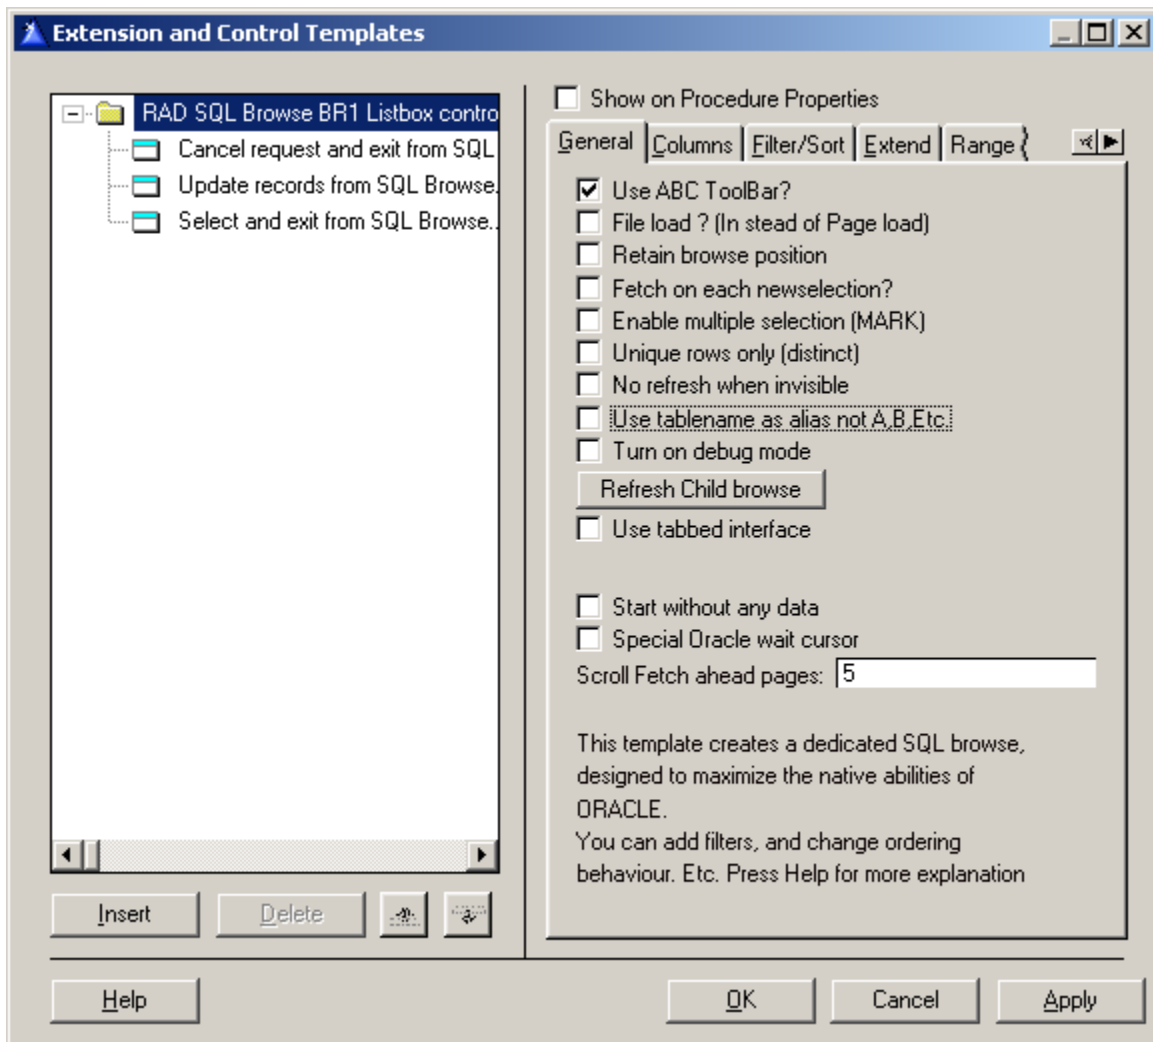

4) Click on select. This window should appear:

This is almost the same window of an ABC Browse procedure (with the ‘**Tables**’ button you must enter the Table(s) the SQL -Browse will use), except this SQL Browse procedure uses an SQL -Browse control, SQL -Update-, Select- and Cancel-Buttons.

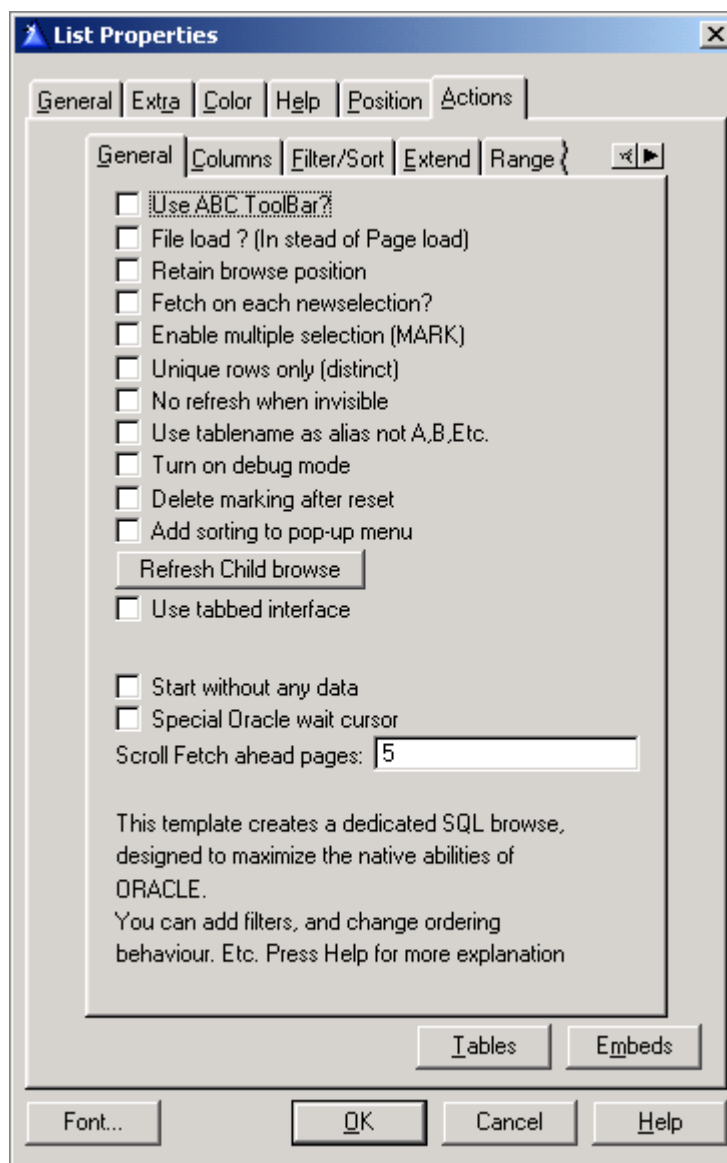

When you press the ‘**Extensions**’ button you will see these SQL controls:

For detailed information about these controls see the documentation of the SQL control templates.

5) When you go to Window-formatter you can populate the SQL Browse with the Table fields in the normal way choosing List Box formatter

### 3 SQL Browse Box Control Template

### 3.1 General

You can use the following options on the template.

***Use ABC Toolbar***

If you want to use the ABC Toolbar buttons for updating, scrolling etc. of the records in the SQL Browse box.

***File Load***

If you want to fill the Browse box queue immediately with all the records of the table. Not recommended for big tables.

***Retain browse position***

Retain last selected record in kind of INI-file. When reopening the browse that record will be selected at start.

***Fetch on new selection***

When checked fetch the new selected record from Table instead of from the view.

***Enable multiple selection (MARK)***

Enable the user to select more then one record in the browse.

***Unique rows only (distinct)***

Sets the DISTINCT statement after SELECT in the SQL -statement.

***No refresh when invisible***

When checked the browse is not refreshed when invisible (for example because the browse is placed on a non selected tab).

***Use table name***

By default the tables in the SQL -statement are named A, B, C etc.

When you want to overrule this and name them by their real names you must check this option.

***Turn on debug mode***

When checked a message with the SQL -statement will be shown for executing the statement.

***Delete marking after reset***

When you want to keep your selected records after a reset, do not check this box. This makes it possible to keep your marked records and select an other subset of data.

***Add sorting to pop-up menu***

This will make available on right mouse click all columns headers to sort on. You will need this when you integrate Clarion-NET, since for the moment in clarion net you cannot double click on a list box header.

***Refresh child browse***

Enter the child browse(s) that must be refreshed after a new selection in the parent browse

***Use tabbed interface***

When you place the browse on sheet with more than one tab you can sort the browse on the column field of the selected tab. For example when you select the fifth tab the browse is sorted on the fifth column field.

***Use Sheet Control***

When you have checked 'Use Tabbed Interface' you have to select the sheet control for this tabbed interface.

***Start without any data***

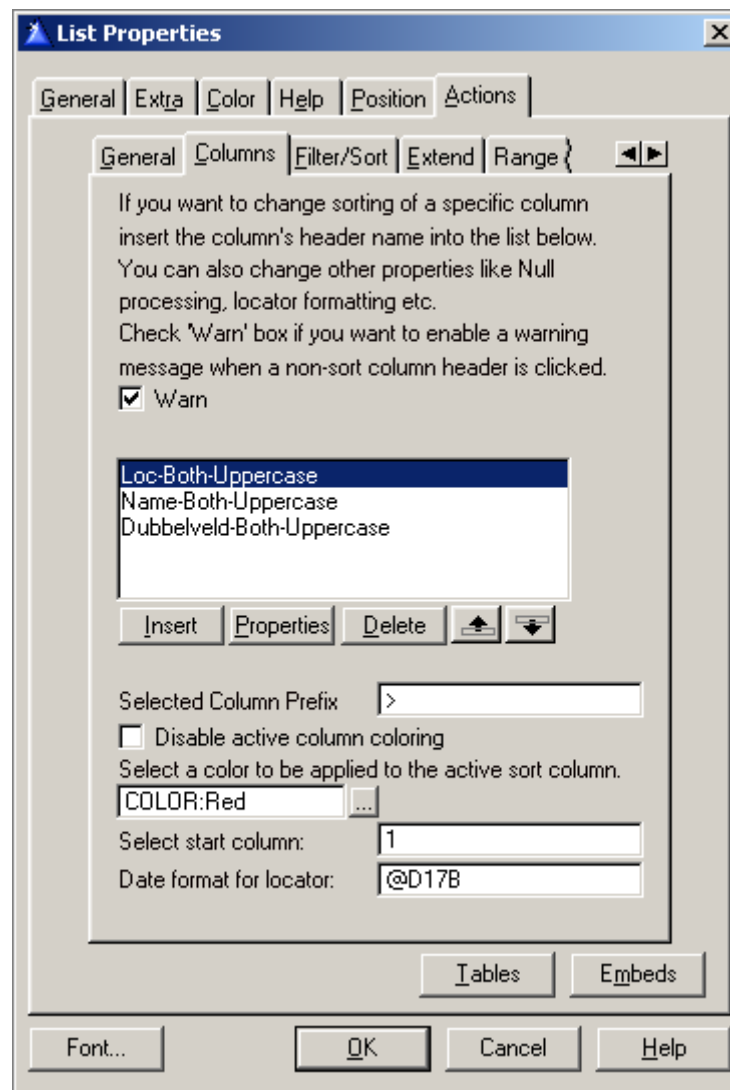

With this option you can start with an empty browse and start filling the browse after some condition or action is completed by setting `Self.DoNotRetrieveAnyData = False`.

***Special Oracle wait cursor***

Check this if you want to see the Oracle wait cursor instead of the default wait cursor. This way the user can see that the program is connecting to the Oracle database.

***Scroll fetch ahead pages***

The number of pages (i.e. number of records in listbox) to read ahead when the user scrolls. The default is 5.

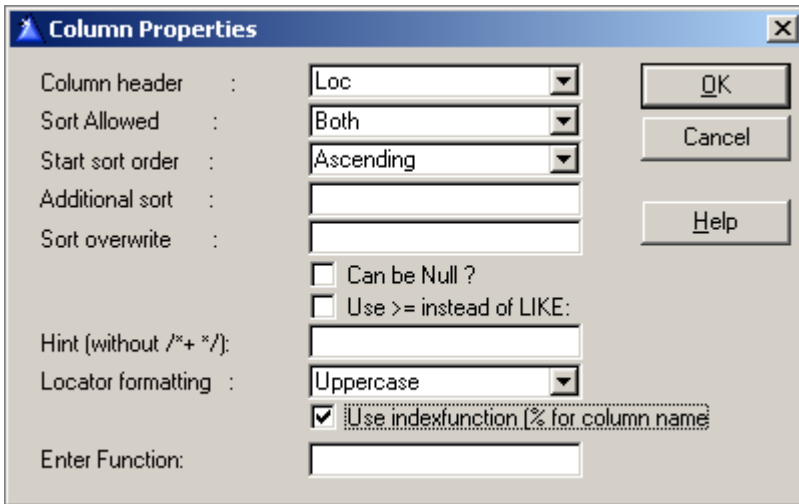

### 3.2 Columns

#### **Warn**

Check this when you want to give the user a message when the user double-clicks on a non-sorted column header.

#### **Columns Listbox**

Here you can add the columns on which you want to sort by double-clicking on the column header.

### ***Column header***

Fieldname of the column.

### ***Sort Allowed***

The sort order allowed for this column:

- Both (Ascending and Descending)
- Ascending (From low to high)
- Descending (From high to low)
- No Sort (No sort allowed: message after clicking the column header)
- Omit Sort (No sort used)

### ***Start sort order***

If Sort Allowed is Both, you can choose the sort (Ascending or Descending) to start.

### ***Additional sort***

Additional field to sort on.

### ***Sort overwrite***

Overwrite the sort of the column field by another field. Useful when you have a local variable in your browse that is based on one or more table fields.

### ***Can be NULL***

Also records where the column field value is NULL will be shown

### ***Use >= instead of LIKE***

When you use the SQL locator for a alphanumeric field the Where clause of the SQL -statement default uses LIKE. As a result you see only those records that start with the locator value. If you also want to see the subsequent records you can use this option.

### ***Hint***

Here you can specify an Oracle Hint.

### ***Locator formatting***

Format for the SQL locator for the columnfield.

***Use index function***

Use a index function for this column.

***Enter function***

When you have checked the “Use index function” you have to enter the function. For example if you have a UPPER function for the column field you can enter UPPER(%).

***Selected Column Prefix***

Prefix on column header when column is the active sort order. Default “>” and “<” for ascending and descending.

***Disable Active Column Coloring***

No specific coloring for the active SORT column.

***Color for active sort column***

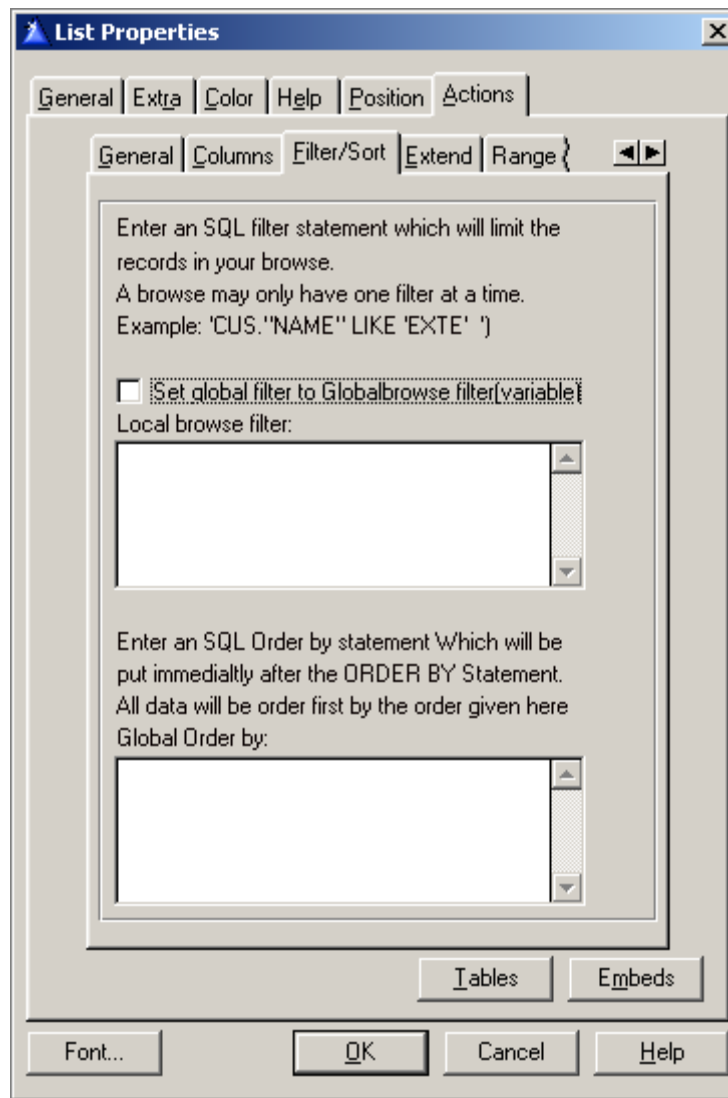

Select color for the active SORT column.

***Select start column***

Select column that will be active on opening the SQL browse.

***Date format for locator***

Date format for SQL locator on date fields in the browse.

### 3.3 Filter/Sort

#### ***Set global filter to Globalbrowse filter***

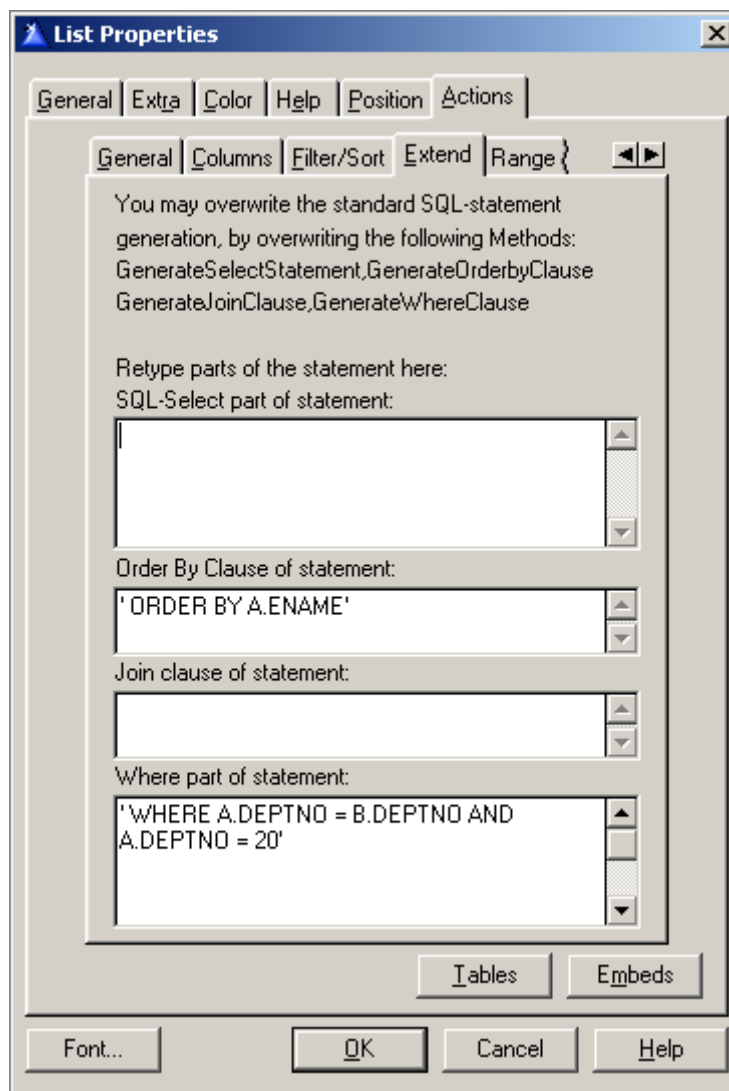

A global filter stored in a global variable “Glo:BrowseFilter” that can be applied through the whole application. When you want to use this global filter in this procedure you have to check this option.

#### ***Local browse filter***

Here you can enter your own filter statement which will be placed after the WHERE statement. For example you can enter ‘A.DNAME LIKE ‘AC%’’, where A is the Alias for SCOTT.DEPT.

#### ***Global order by***

Here you can enter the field(s) to always sort on first.

### 3.4 Extend

***SQL Select part of statement***

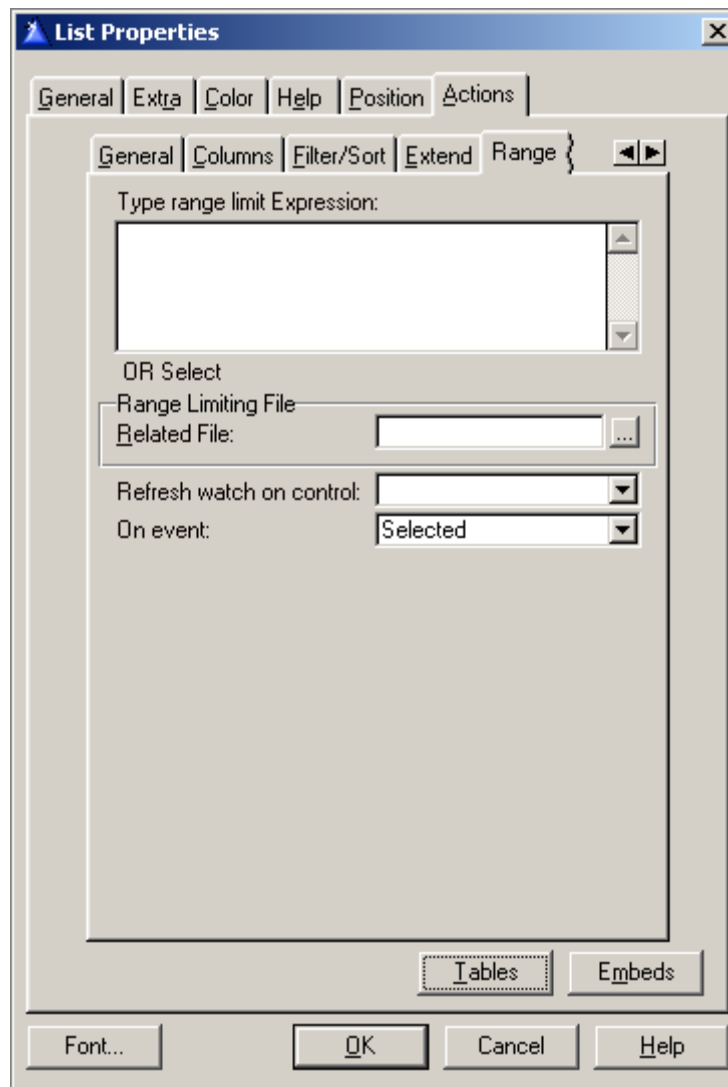

Overwrite SELECT part of generated SQL -statement with your own SELECT.

**Order By Clause of statement**

Overwrite ORDER BY part of generated SQL -statement with your own ORDER BY.

**Join Clause of statement**

Overwrite JOIN part of generated SQL -statement with your own JOIN.  
**Where part of statement**  
Overwrite WHERE part of generated SQL -statement with your own WHERE.

### 3.5 Range

#### ***Range Limit expression***

You can enter a Range Limit expression that will be placed after the WHERE part of the SQL statement.

#### ***Range Limiting File***

Or you can select the related Table for the Range Limit.

#### ***Refresh watch on control***

Force refresh browse after an event for this control

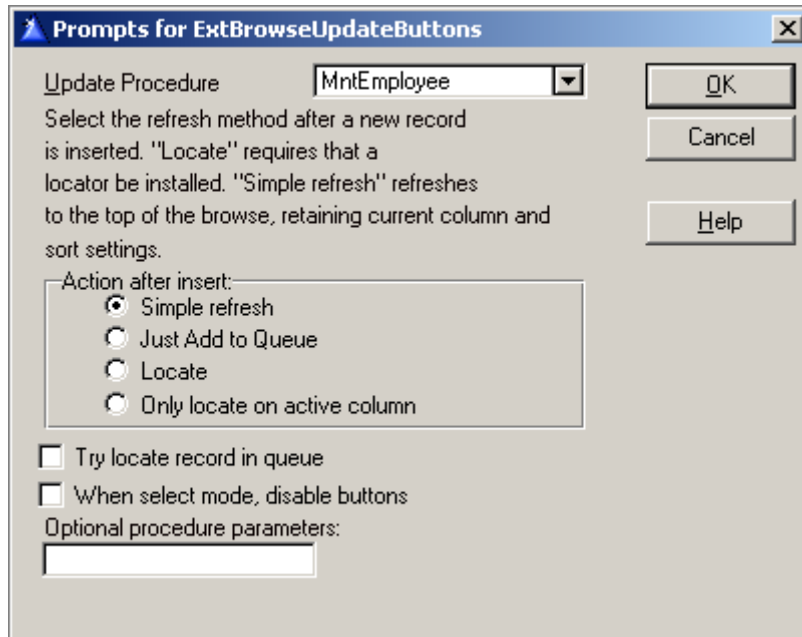

#### ***On event***

Select the event to force the browse refresh.

The last four tabs of the Browsebox actions '**Hotfields/Buffering**', '**Colors**', '**Icons**' and '**Classes**' are similar to the normal ABC browsebox, except that the default class is ABC:ExtSQL B

## 4 SQL Browse Box Update Buttons Control Template

### 4.1 Prompts for BrowseUpdateButtons

#### *Update Procedure*

The name of the update procedure (Form). If you enter a new procedure name the Application Generator adds the new procedure to the Application Tree.

#### *Action after insert*

Chose here between:

#### *Try locate record in queue*

Try locate record in queue after update.

#### *When selected mode, disable buttons*

If checked the update buttons are disabled when the Browse procedure is called with globalrequest is SelectRecord.

#### *Optional procedure parameters*

## **5 SQL Browse Box Select Button Control Template**

This control template has no programmers input.

The select button updates the records content, closes the browse and returns RequestCompleted.

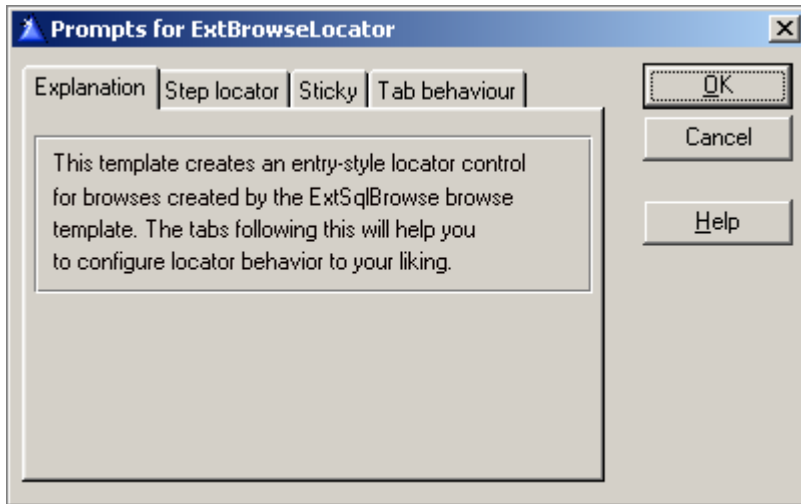

The select button is hidden when the browse procedure is not called with the SelectRecord request.

### SQL Browse Box Cancel Button Control Template

This control template has no programmers input.

The cancel button closes the browse and returns RequestCancelled.

## 6 SQL Browse Box Locator Control Template

### ***Step Locator***

Default the locator is “entry-style” : the locator executes after leaving the locator with TAB entry. If you want to locate on every entry in the locator, you have the check the “Step locator” and turn the IMM attribute of the locator on.

### ***Sticky***

If you check the “sticky locator”, the selection made in the locator on the active column is saved when you select another column where you can locate further in the saved selection.

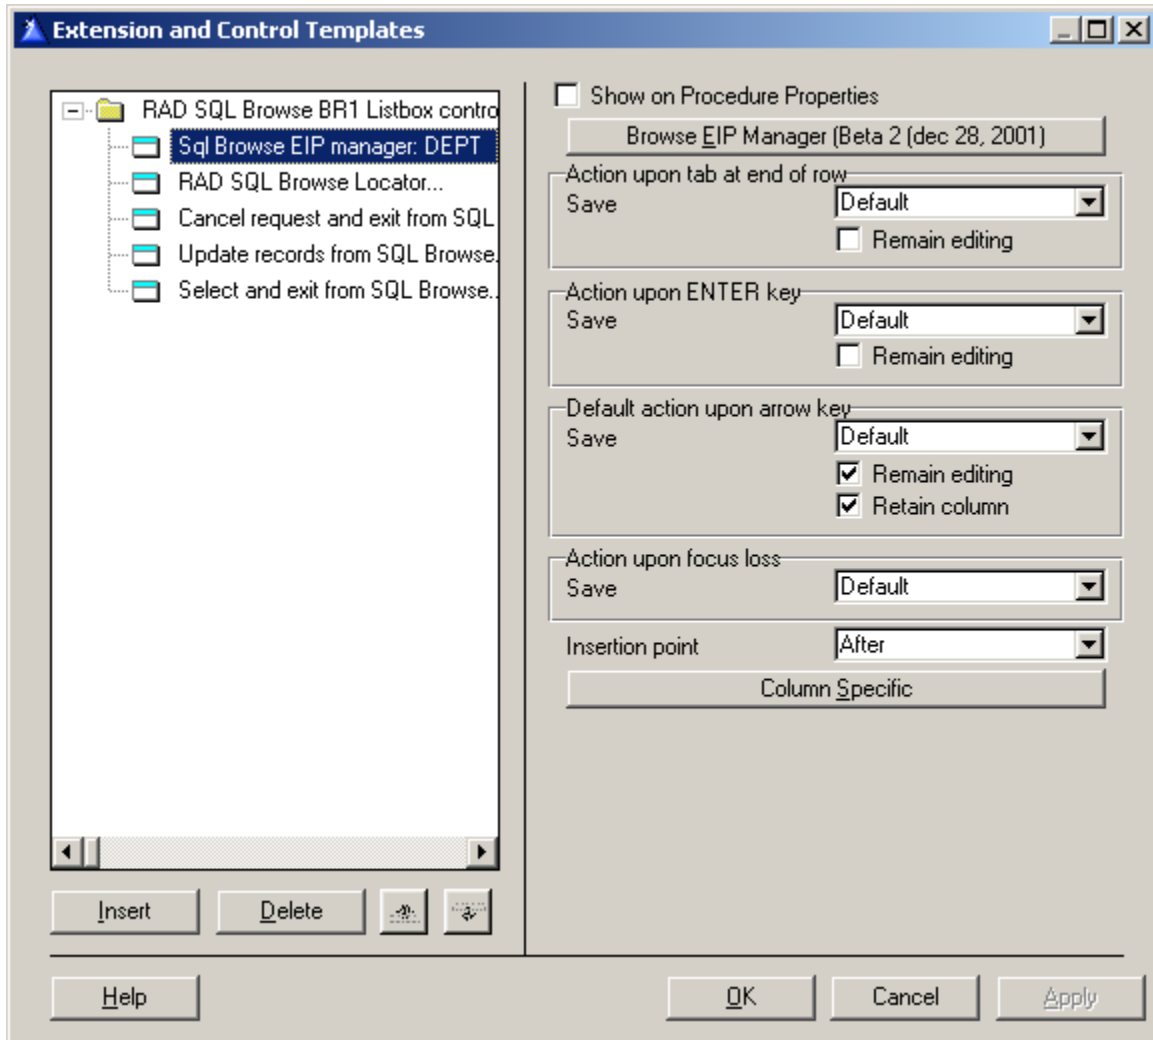

### ***Depends on byte field***

If you use the sticky locator, you have to enter a byte check field on the window to set (when byte = 1) or reset (when 0) the sticky locator.

### ***Tab behavior***

When you check “Jump form browse box to locator after TAB” the locator is selected again after Tabbing out of locator.

SQL Browse Box EditInPlace Extension Template

**Save**

The Configure Edit in place dialog offers the Save option for four different keyboard actions. These options determine whether changes to an edited record are saved or abandoned upon the following keyboard actions: TAB key at end of row, ENTER key, up or down arrow key, focus loss (changing focus to another control or window, typically with a mouse-click). Choose from:

- Default
- Always on TAB key end of row.
- Prompted on the other key actions.

Always  
Always save the record.  
Never  
Never save the record, abandon the changes.

***Prompted***

Ask the end user whether to save or cancel the changes.

***Remain editing***

If checked the user continues to edit after the specified key action

**Remain column**

If checked the continues to edit in the same listbox column

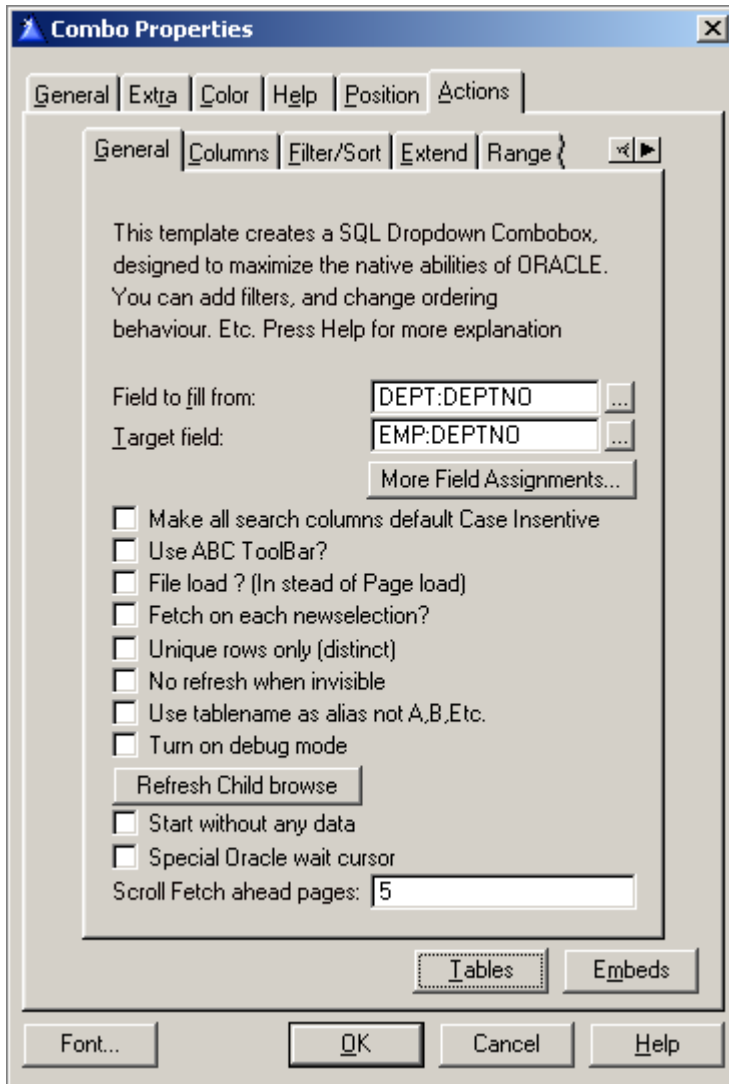

**Insertion point**

The Configure Edit in place dialog offers the Insertion Point option for initial new record placement in the list. The droplist choices before, after, and append— indicate where the edit-in-place row will appear in the list when inserting a record. Before and after indicate placement in relation to the highlighted record, and append places the edit-in-place row at bottom of the list.

**Column specific**

Press this button, then press the Insert button to disable a specific column for Edit in Place or to specify the CLASS of object to use when editing a specific list box column.

## 7 SQL DropDownCombo Control Template

The SQL DropCombo control is basically a SQL Browselist with an additional locator/entryfield and an optional updateprocedure. Therefore, the most options for this control are the same as the options for the SQL Browse control. Here the extra options are mentioned.

### ***Field to fill from***

The field in the lookup file whose value is assigned to the Target Field. Press the ellipsis (...) button to select from the Select Field dialog.

***Target field***

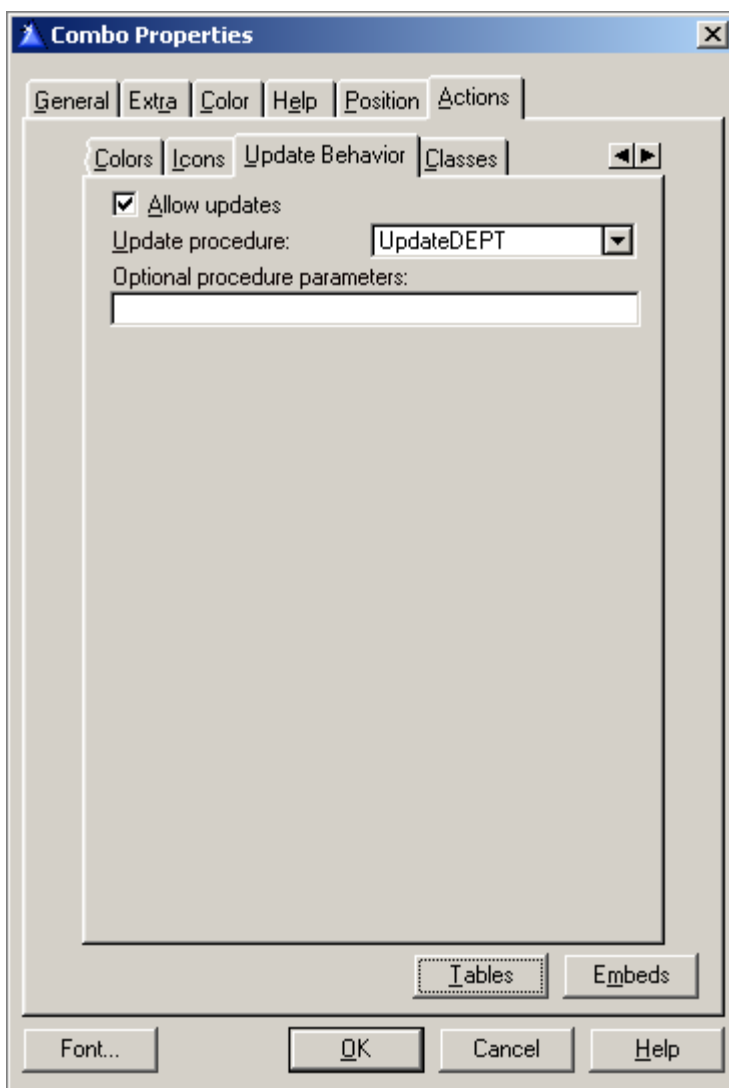

The field that receives the value from the Field to fill from. Press the ellipsis (...) button to select from the Select Field dialog.

***More Field Assignments***

Add additional fill from/ target fields combinations.

***Search columns default Case Insensitive***

Make the locator/entry field case insensitive for locating records in the browse.

***Allow updates***

Allow the user to insert records after entering a value in the locator/entry field that does not exist in the table.

***Update procedure***

Name the procedure to call to add the new record, or leave this field blank if no update procedure is needed.

***Optional parameters***

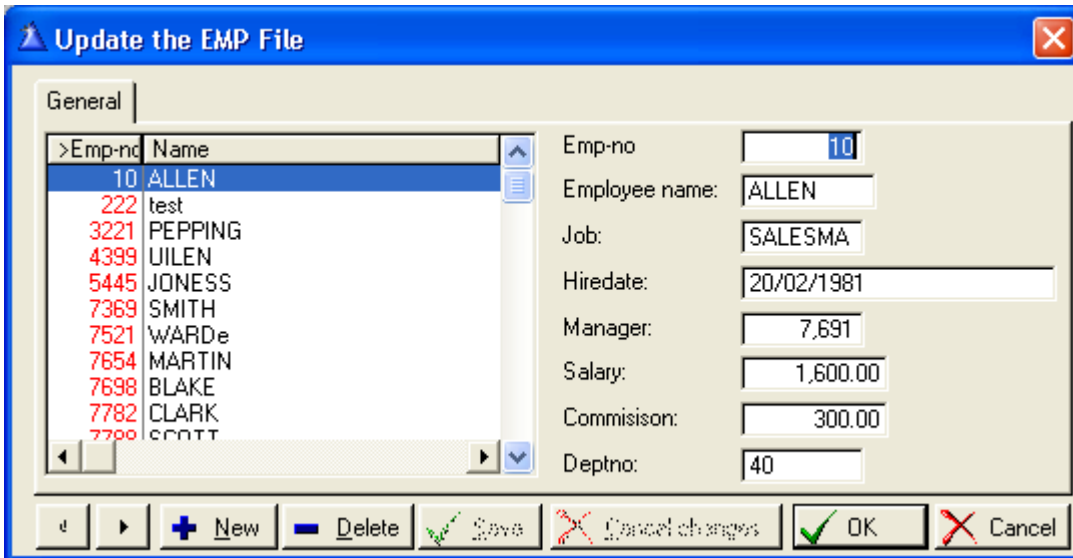

Here you can enter the parameters for the update procedure if needed.

## 8 SQL Browse update combination

The SQL browse/update combination combines the browse and form into one window. This almost makes separation between browse and form into two procedures obsolete.

The result of this template is a screen as shown below:

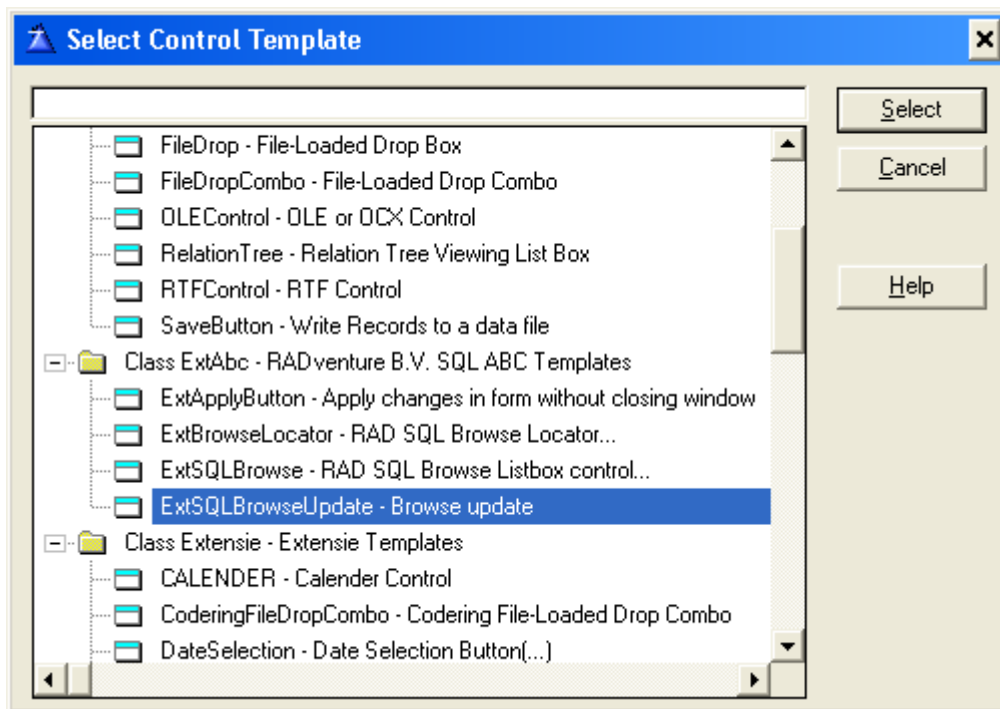

Emp-no	Name
10	ALLEN
222	test
3221	PEPPING
4399	UILEN
5445	JONESS
7369	SMITH
7521	WARDe
7654	MARTIN
7698	BLAKE
7782	CLARK
7799	SCOTT

Emp-no: 10  
 Employee name: ALLEN  
 Job: SALESMA  
 Hiredate: 20/02/1981  
 Manager: 7,691  
 Salary: 1,600.00  
 Commisison: 300.00  
 Deptno: 40

Buttons: New, Delete, Save, Cancel changes, OK, Cancel

To build this procedure, first make a default form procedure. Add to this procedure the RadSQL browse update (list box). Then add the SQL Browse update template. This will automatically add 6 buttons to your form. There is no coding required. A lot of extra embed points are added.

The control 'Browse update' is selected via the following control select window:

## 9 SQL View Manager

### 9.1

#### SQL View Managers Properties

**ViewTablelist** &Ext\_TableList

The ViewTableList is a queue with the tables used in the view

**ViewFieldpairs** &Ext\_FieldpairQueue

This queue links the Queue field to the View field. Pointers do this.

**SQL Joinfields** &Ext\_Joinfields

A queue of the fields used in the join

**SelectStatement** CString(2000)

This string is the generated complete SQL select statement

**GlobalSortOrder** CString(500),private

Global order by clause will always be directly after order by

**OrderByclause** CString(1500)

The order by clause for the SQL statement

**Fromclause** CString(500)

The from clause for the SQL statement

**Joinclause** CString(1000)

The join clause for the SQL statement

**Whereclause** CString(2000)

The Where clause for the SQL statement

**ViewSQL Statement** CString(2000)

The complete SQL Statement for the view

**OldSQL statement** CString

The old SQL statement

**Locatorfilter** CString(500)

Filter forced by locator

**SQL Filter** CString(1000)

Filter on View

**RangeFilter** CString(1000),protected

Range applied

**QBFilter** CString(1000)

Filter from QBE

**Hint** CString(100),protected

Hint

**ManagedView** &View  
The managed view

**RecordsInPage** ULong  
Number of records in listbox

**Pagesize** Short  
Number of records in listbox

**NoReFill** Byte,protected  
No refill of view

**StickyLocator** Byte,protected  
Sticky locator active

**QBEActive** Byte  
Is the QBE active ?

**DebugMode** Byte  
If 1 turns debug mode on

**UseTableasAlias** Byte  
If 1 return table name as alias not A,B, etc.

**Distinct** Byte  
If 1 adds distinct keyword

**Viewopened** Byte,private  
The view was opened if 1

**Eof** Byte,protected  
End of file reached

### 9.1.1 SQL View Managers Methods

**AddViewfieldpair** (link the Queue field to the View field)

**AddViewfieldpair** (Ref\_Queuefield, Ref\_ViewField, In\_Tablename, In\_SQL field, in\_fieldno, in\_colno)

Ref_QueueField	*?	Reference to field in queue
Ref_ViewField	*?	Reference to field in view
In_TableName	String	Tablename
In_SQL Field	String	Fieldname
In_FieldNo	Byte	Fieldnumber in table
In_ColNo	Byte	Fieldnumber in browse

**AddViewfield (Add field to the view, not in queue p.e. joinfield)**

**AddViewfield (In\_Tablename, In\_SQL field, In\_fieldno)**

In_TableName	String	Tablename
In_SQL Field	String	Fieldname
In_FieldNo	Byte	Fieldnumber in table

**AddTable (Add Table to TableList)**

**AddTable (In\_table, In\_fileno, In\_Qbeadded),Virtual**

In_Table	String	Tablename
In_FileNo	Byte	Tablenumber
In_QBEadded	Byte	QBE added

**AddJoinFields (Add joinfieldpairs)**

**AddJoinFields (Table1, Field1, Table2, Field2, Outerjoin, QbeAdded)**

Table1	String	First tablename
Field1	String	Field of first table
Table2	String	Second tablename
Field2	String	Field of second table
OuterJoin	Byte	Use outerjoin
QBEadded	Byte	QBE added

**AddMarkField (Add markfield to Queue)**

**AddMarkField (Ref\_Queuefield)**

Ref_QueueField	*?	Reference to queue
----------------	----	--------------------

**OpenView** (Open the view)

**OpenView** ()

**GenerateSelectStatement** (Generate SELECT part of SQL statement)

**GenerateSelectStatement** (),Virtual

**GenerateFromClause** (Generate FROM part of SQL statement)

**GenerateFromClause** (),Virtual

**GenerateOrderByClause** (Generate ORDER BY part of SQL statement)

**GenerateOrderByClause** (),Virtual

**GenerateJoinClause** (Generate JOIN part of SQL statement)

**GenerateJoinClause** (),Virtual

**GenerateWhereClause** (Generate WHERE part of SQL statement)

**GenerateWhereClause** (),Virtual

**AddGlobalSortOrder** (Global sortorder added to the ORDER BY part of SQL statement)

**AddGlobalSortOrder** (),Virtual

**AddGlobalFilter** (Possibility to override the global SQL Filter. New global filter will be added to WHERE part of SQL statement)

**AddGlobalFilter** (),Virtual

**ExecuteSQL** (SQL statement executed by View{Prop:SQL } = SQL statement)

**ExecuteSQL** (),Virtual

**SetLocatorFilter** (Set filter from locatorfield)

**SetLocatorFilter (In\_LocFilter),Virtual**

In\_LocFilter          String                  Locator filter statement

**SetFilter (Set SQL filter for the WHERE part of SQL statement)**

**SetFilter (In\_Filter),Virtual**

In\_Filter                String                  Filter statement

**SetRange (Possibility to enter or override a RangeFilter for the WHERE part of SQL statement)**

**SetRange (),Virtual**

**SetGlobalSortOrder (Set the global ORDER BY)**

***9.1.1.1 SetGlobalSortOrder (In\_Order)***

In\_Order                String                  Order statement

**SetStickyLocator (Enable/disable stickylocator that saves previous locator filters)**

***9.1.1.1.2 SetStickyLocator (In\_Sticky)***

In\_Sticky                Byte                    True or false to enable or disable stickylocator

**Init (Initialize view)**

***9.1.1.1.3 Init ()***

**Next (Next record of the view, returns 1 if EOF else 0)**

***9.1.1.1.4 Next (),Byte,Virtual***

In your SQL Browse you can use the derived Next method to validate the record by setting Self.ManualFiltered to True in the embed after the Parent.Next if you want to exclude the validated record from the listbox queue.

**Previous** (Previous record of the view, returns 1 if ErrorCode else 0)

**9.1.1.1.5 Previous** (*Byte,Virtual*)

**GetAlias** (Returns the alias of the tablename)

**9.1.1.1.6 GetAlias** (*In\_TableName,String*)

In_TableName	String	Tablename
--------------	--------	-----------

**SetSort** (Set sort for ORDER BY part of SQL statement)

**9.1.1.1.7 SetSort** (*In\_tablename, In\_SetSortfield, Ordertype*)

In_TableName	String	Tablename
In_SetSortfield	String	Field to sort on
Ordertype	String	Ascending/Descending

**AppendSort** (Add additional sortfield for ORDER BY part of SQL statement)

**9.1.1.1.8 AppendSort** (*In\_tablename, In\_SetSortfield, Ordertype*)

In_TableName	String	Tablename
In_SetSortfield	String	Field to sort on
Ordertype	String	Ascending/Descending

**ResetView** (Reset of the view, calls ExecuteSQL with new SQL statemet)

**9.1.1.1.9 ResetView** (*Virtual*)

**Destruct** (Destruct view object)

*9.1.1.1.10 Destruct ()*

**ClearQueue** (Clear records of queue and dispose of queue)

*9.1.1.1.11 ClearQueue (QueueInstance)*

QueueInstance      \*Queue      Reference to a queue

## 11 SQL Browse Managers Properties

### **AddFieldpairs (Link Queuefield to Viewfield)**

**11.1.1.1.1 AddFieldpairs (Ref\_Queuefield, Ref\_ViewField, In\_Tablename, In\_SQL field, IN\_Type, In\_CanBeNull, In\_SortASCDES, In\_DefSort, IN\_Case, IN\_USEGE, In\_fieldno, in\_colno), Virtual**

Ref_Queuefield	*?	Reference to the queue
Ref_Viewfield	*?	Reference to the view
In_Tablename	String	Tablename
In_SQL field	String	SQL field
In_Type	String	Type
In_CanBeNull	Byte	Can be NULL value
In_SortASCDES	String	Sort Ascending/Descending
In_DefSort	String	Default sort
In_Case	String	Case
In_UseGE	String	Use Greater or Equal (instead of LIKE)
In_FieldNo	Byte	Field number
In_ColNo	Byte	Column number

### **AddIndexFunction (Add indexfunction for columnfield)**

**11.1.1.1.2 AddIndexFunction (IndexFunction)**

IndexFunction	String	The indexfunction for the field
---------------	--------	---------------------------------

### **AddSort (Add extra sortorder for columnfield)**

**11.1.1.1.3 AddSort (in\_columnnr, in\_sortorder)**

In_Columnnr	Byte	Column number
In_SortOrder	String	Sort order for field

### **OverwriteSort (Override sortorder for columnfield with other field)**

***11.1.1.1.4 OverwriteSort (in\_columnnr, in\_sortorder)***

In_Columnnr	Byte	Column number
In_SortOrder	String	New sort order for field

**SetListcontrol (Set listcontrol for SQL browse class)**
***11.1.1.1.5 SetListcontrol (ListControl)***

Listcontrol	Signed	The listcontrol
-------------	--------	-----------------

**GetColumn (Return active column number)**
***11.1.1.1.6 GetColumn (),byte, Virtual***
**FillPage (Fill listbox queue from view)**
***11.1.1.1.7 FillPage (), Virtual***
**UpdateWindow (Enable/disable buttons depending on listbox)**
***11.1.1.1.8 UpdateWindow (), Virtual***
**SetFileLoad (Set filling listbox to fileload instead of pageload)**
***11.1.1.1.9 SetFileLoad ()***
**Init (Initialize browse class object)**
***11.1.1.1.10 Init (<Filemanager>), Virtual***

FileManager	Class	The filemanager class
-------------	-------	-----------------------

**TakeEvent** (Handle events for listbox ,locator and buttons)

*11.1.1.1.11 TakeEvent () , Virtual*

**TakeKey** (Handle alertkeys for the listbox)

*11.1.1.1.12 TakeKey () , Virtual*

**InsertRecord** (Insert record)

*11.1.1.1.13 InsertRecord (SuppressClear), Virtual*

Suppressclear          Byte          Suppress clear of filebuffer, default false

**UpdateRecord** (Update highlighted record)

*11.1.1.1.14 UpdateRecord () , Virtual*

**DeleteRecord** (Delete highlighted record)

*11.1.1.1.15 DeleteRecord () , Virtual*

**SelectRecord** (Select highlighted record)

*11.1.1.1.16 SelectRecord () , Virtual*

**TakeScroll** (Handle scroll events)

*11.1.1.1.17 TakeScroll (E)*

E Signed Scroll event

**ScrollOne (Scroll one record up or down)**

***11.1.1.1.18 ScrollOne (Ev)***

Ev Signed Event scrollup or scrolldown

**ScrollPage (Scroll one page)**

***11.1.1.1.19 ScrollPage (Direction)***

Direction Signed Direction up or down

**Previous (Get previous record)**

***11.1.1.1.20 Previous (),Byte, Virtual***

**SetQueueRecord (Fill queuerecords fields with values from view)**

***11.1.1.1.21 SetQueueRecord (), Virtual***

**TakeNewSelection (Handle new selection in listbox)**

***11.1.1.1.22 TakeNewSelection (), Virtual***

**FetchRecord (Retrieve selected record)**

***11.1.1.1.23 FetchRecord (In\_forcefetch), Virtual***

In\_forcefetch Byte If true first a reget of the view

**AddLocator (Add locator for listbox)**

***11.1.1.1.24 AddLocator (Iby\_locatorcontrol,Iby\_promptControl)***

Iby_Locatorcontrol	Signed	Locatorcontrol of listbox
Iby_Promptcontrol	Signed	Prompt of locator

**AddItem (Add EditInPlace)**
***11.1.1.1.25 AddItem (In\_EIPManager)***

In_EIPManager	SQL BEipManager EditInPlace manager class
---------------	---

**ResetLocator**
***11.1.1.1.26 ResetLocator (), Virtual***
**LocateRecord (Locate record from locators value)**
***11.1.1.1.27 Locaterecord (), Virtual***
**ResetBrowse (Reset of browse)**
***11.1.1.1.28 ResetBrowse (Forcerefill), Virtual***

ForceRefill	Byte	If true a reset of the view is performed
-------------	------	--

**ResetSort (Reset sort order based on selected column)**
***11.1.1.1.29 ResetSort (In\_col), Virtual***

In_Col	Byte	Column number
--------	------	---------------

**ResetChildren** (Reset of child browses)

*11.1.1.1.30 ResetChildren* (), *Virtual*

**RegetFromFile** (Reget record values from file after completed update)

*11.1.1.1.31 RegetFromFile* (), *Virtual*

**LocateAfterInsert** (Locate record in listbox after insert)

*11.1.1.1.32 LocateAfterInsert* (), *Virtual*

**SetToDate** (Return Oracle dateformat)

*11.1.1.1.33 SetToDate* (*In\_date, In\_format*), *String*

In_Date	Long	Date/Timefield
In_Format	Long	Date or time

**SetSortColColor** (Set color for active sort column)

*11.1.1.1.34 SetSortColColor* (*In\_color*)

In_color	ULong	Date/Timefield
----------	-------	----------------

**SetForceFetch** (Set forcefetch to true or false for FetchRecord)

*11.1.1.1.35 SetForceFetch* (*InForceFetch*)

InForceFetch	Byte	True or false
--------------	------	---------------

**SetColLocatorFilter (Set locatorfilter for active column)**
***11.1.1.1.36 SetColLocatorFilter (Locatorvalue), Virtual***

LocatorValue	String	Value from locator
--------------	--------	--------------------

**SetHint (Set hint for active column)**
***11.1.1.1.37 SetHint (In\_col, in\_hint)***

In_Col	Byte	Column number
In_hint	String	Oracle hint

**SetAlerts (Add popup for update and marking)**
***11.1.1.1.38 SetAlerts (), Virtual***
**NoRecords (Dummy, programmer can handle no records in listbox)**
***11.1.1.1.39 NoRecords (), Virtual***
**RunForm (Run updateform for insert, update or delete record)**
***11.1.1.1.40 Runform (in\_Request), Virtual***

In_Request	Byte	Insert-, Change- or DeleteRecord
------------	------	----------------------------------

**AddToolbarTarget (Hook ABC toolbar into SQL Browse)**
***11.1.1.1.41 AddToolbarTarget (T)***

T	ToolbarClass	Toolbarclass
---	--------------	--------------

**UpdateToolBarButtons** (Connect browsebuttons with toolbarbuttons)

*11.1.1.1.42 UpdateToolBarButtons* ()

**SetQBEMActive** (Set QueryByExample is active to true or false)

*11.1.1.1.43 SetQBEMActive* (*In\_QBEMActive*)

In\_QBEMActive      Byte              True or false

**Destruct** (Dispose of browseclass object)

*11.1.1.1.44 Destruct* ()

**Debug** (If in special debugmode show debugmessage)

*11.1.1.1.45 Debug* (*DebugMessage*)

Debugmessage      String              Message

**GetPrimaryKey** (Return primary key of table)

*11.1.1.1.46 GetPrimaryKey* (*File F*), *\*Key*, *Virtual*

F                      File                  Filelabel

**RetainBrowsePosition** (Retain browse position at opening browse or after update)

*11.1.1.1.47 RetainBrowsePosition* (*StartCol*, *UseQueue*), *Virtual*

StartCol              Byte                  Column number to sort on

UseQueue	Byte	If true retain from last selected record. If false from INI-file
----------	------	--

**SaveBrowsePosition (Save browseposition in INI-file)**

**11.1.1.1.48 SaveBrowsePosition ( ), Virtual**

**SetMarking (Turn marking on or off)**

**11.1.1.1.49 SetMarking (SetMarkOnOrOff), Virtual**

SetMarkOnOrOff	Byte	Turn marking on or off
----------------	------	------------------------

**SetMarkRange (Turn mark on or off for range of records in listbox)**

**11.1.1.1.50 SetMarkRange (BeginPosition, EndPosition, SetMarkOnOrOff, CurrentChoice), Virtual**

BeginPosition	Long	Beginposition in listbox
EndPosition	Long	Endposition in listbox
SetMarkOnOrOff	Byte	Turn mark on or off for range
CurrentChoice	Long	If not 0 this record is not turned on or off

## 12 SQL EditInPlace Manager

[ClearColumn](#)

[Construct](#)

[CopyDbFields \(V\)](#)

[Init](#)

[InitControls](#)

[Kill](#)

[NoEIPCol](#)

[SetRequest](#)

[TakeCompleted](#)

[TakeEvent](#)

[TakeNewSelection](#)

### 12.1 SQL EditInPlace Managers Methods

**InitControls** (Initialize edit in place fields of listbox)

*12.1.1.1 InitControls ()*

**ClearColumn** (Handle EIP record when new selection)

*12.1.1.1.2 ClearColumn ()*

**Construct** (Make new Edit in Place object)

*12.1.1.1.3 Construct ()*

**Init** (Initialize EditInPlace object)

*12.1.1.1.4 Init (),Byte*

**Kill** (Dispose of EditInPlace object)

**12.1.1.1.5**    *Kill*    (*Byte*)

**CopyDbFields**    (Copy Queuefields to viewfields before insert or change record is completed)

**12.1.1.1.6**    *CopyDbFields*    (*Virtual*)

**TakeCompleted**    (Handle EditInPlace of row is completed)

**12.1.1.1.7**    *TakeCompleted*    (*Force*)

Force                      Byte                      With or without asking user

**TakeEvent**    (Handle events)

**12.1.1.1.8**    *TakeEvent*    (*Byte*)

**TakeNewSelection**    (Handle selection of new row)

**12.1.1.1.9**    *TakeNewSelection*    (*Byte*)

**SetRequest**    (Set request for EditInPlace action)

**12.1.1.1.10**    *SerRequest*    (*In\_Request*)

In\_Request                      Byte                      Insert or Update

**NoEIPCol**    (Set column to no EditInPlace allowed)

**12.1.1.1.11**    *NoEIPCol*    (*In\_Col*)

In\_Col                      Byte                      Column number where no EIP is allowe

## 13 SQL DropCombo Manager

[AddDropVariables](#)  
[AddField \(V\)](#)  
[Construct](#)  
[Destruct](#)  
[FetchRecord \(V\)](#)  
[InsertRecord \(V\)](#)  
[LocateRecord \(V\)](#)  
[ResetSort \(V\)](#)  
[RunForm \(V\)](#)  
[SetListControl](#)  
[StartUpdateProcedure \(V\)](#)  
[TakeEvent \(V\)](#)

### 13.1 SQL DropCombo Managers Methods

**Construct** (Initialize queues used by drop combo class)

*13.1.1.1 Construct ()*

**Destruct** (Free queues used by drop combo class)

*13.1.1.1.2 Destruct ()*

**SetListControl** (Initialize listcontrol used by drop combo class)

*13.1.1.1.3 SetListControl (ListControl)*

Listcontrol                      Signed                      The Field Equate Label of the droplist

**TakeEvent** (Event handling for list- and locatorcontrol)

***13.1.1.1.4 TakeEvent (), Virtual***

**FetchRecord (Retrieve selected record)**

***13.1.1.1.5 FetchRecord (In\_ForceFetch), Virtual***

In\_ForceFetch          Byte                  If true first a reget of the view

**AddDropVariables (Initialize droplist variables)**

***13.1.1.1.6 AddDropVariables (Iby\_locatorcontrol, Iby\_promptControl, UseField, FillField, FillFieldReference, TargetReference)***

Iby_locatorcontrol	Signed	Field Equate Label of locatorcontrol
Iby_promptcontrol	Signed	Field Equate Label of locators prompt
UseField	*?	The use variable of the droplist
FillField	String	Field to fill from
FillFieldReference	*?	Reference to the field to fill from
TargetReference	*?	Reference to the field to fill, the targetfield

**LocateRecord (Locate record for value entered in the locatorcontrol)**

***13.1.1.1.7 LocateRecord (), Virtual***

**ResetSort (Reset sort order based on active column)**

***13.1.1.1.8 ResetSort (In\_Col), Virtual***

In\_Col                  Byte                  Column number

**AddField (Add field combinations: fill from fields/targetfields)**

***13.1.1.1.9 AddField (Source, Destination), Virtual***

Source	*?	Reference to field to fill from
Destination	*?	Reference to field to fill , the target field

**RunForm (Set global request for updateprocedure)**

***13.1.1.1.10 RunForm (In\_Request), Virtual***

In_Request	Byte	GlobalRequest for updateprocedure, in case of this droplist only insertrecord
------------	------	---

**InsertRecord (Prime record before going to update procedure and reset of the browse if response is requestcompleted)**

***13.1.1.1.11 InsertRecord (SurpressClear), Virtual***

SurpressClear	Byte	If true suppress clearing of filebuffer before calling RunForm with request is insertrecord
---------------	------	---

**StartUpdateProcedure (Get of view or clearing of filebuffer depending on surpressclear before calling insertrecord)**

***13.1.1.1.12 StartUpdateProcedure (SurpressClear), Virtual***

SurpressClear	Byte	If true suppress clearing of filebuffer before calling Insertrecord
---------------	------	---
